COVERFI PROTOCOL · DEMO DAY PITCH PACKAGE · V2

The missing credit-protection primitive for on-chain real-world assets.

Seven minutes. Three presenters. One deployed protocol. This document is the operator-grade script, click runbook, investor close, business model, ROI calculator, SWOT, and Q&A defense matrix for the HashKey Chain Horizon Hackathon finals.

Event	HashKey Chain Horizon Hackathon — Final Demo Day
Venue	AWS Office, Hong Kong
Date	April 22, 2026
Duration	7 minutes + Q&A
Format	Three-person demo · D (voice) + P (voice) + B (hands)
Deployment	HashKey Chain Testnet · Chain ID 133 · 12 contracts · 416 tests
Live app	`coverfi-protocol.vercel.app`
Live pitch deck	`coverfi-protocol.vercel.app/pitch.html`

Contents

1 · Role Assignments

Three people. Two voices. Zero confusion. Each role owns roughly one-third of the runtime burden — D and P split the 7 minutes of speaking, B handles every click.

D **TECHNICAL ANCHOR**

Problem framing · IRS score reveal · money-shot technical narration · ROI calculator driver · moat/tech depth

Natural cadence: steady, declarative, evidentiary.

P **COMMERCIAL NARRATOR**

Category introduction · pool architecture · subrogation emotional beat · business model · SWOT · close

Natural cadence: narrative, builds momentum, owns the close.

B **OPERATOR (SILENT)**

Drives the laptop. Every click, every scroll, every tab switch. Reacts to trigger phrases from D and P.

Never speaks. Not to correct, not to cover, not to narrate.

Physical staging

- **D stands screen-left. P stands screen-right.** B sits at the laptop.
- D and P never speak over each other — each finishes the line before the other starts.
- Neither D nor P looks at the screen. Eye contact is with the back row.
- B never speaks. Hands only.
- Headphones for everyone if two-laptop / remote setup (prevents echo).

Why split the voice

- Breaks listener fatigue around minute 4 when a single voice becomes monotone.
- D and P have different natural cadences — contrast keeps the room awake.
- Each owns half the runtime, so neither loses their line during stage nerves.
- Visible teamwork signals execution maturity to investor-type judges.

> **Lock the roles tonight.** Do not swap D↔P at the venue. Memory is muscle; the muscle is cast at rehearsal, not at the podium.

2 · App Audit

Verified from the repo at `D:\COVERFI\`. All claims map back to committed code, deployed contract addresses, or on-chain transactions on `testnet-explorer.hsk.xyz`.

What is actually implemented

LAYER	DELIVERABLE	STATE
Smart contracts	12 production + 4 mocks + ABDKMath library	Deployed 2026-04-13, all verified on HashKey Chain 133
Test suite	416+ unit tests, 40 edge-case, full-lifecycle integration, Playwright E2E	All passing
Frontend app	10 HTML pages, dark-mode, MetaMask integration, Claymorphism design	Live on Vercel
Pitch deck	Vercel-style SPA with 12 pages including interactive ROI calculator	Live at `/pitch.html`
On-chain evidence	25+ real TXs including a confirmed default + payout + SubrogationNFT #1	Verifiable today

Best demoable features — ranked by narrative power per second

1. **SubrogationNFT #1** on `subrogation.html` — the bridge between on-chain insurance and off-chain legal recovery.
2. **PayoutEngine TX** on HashKey explorer — one transaction, four events, atomic waterfall.
3. **Live coverage purchase** on `dashboard.html` — the money shot.
4. **ROI calculator** on `pitch.html` — investor-grade live sliders, instant revenue model.
5. **Premium curve** on `stats.html` — continuous exponential on-chain credit scoring.
6. **Business Model + SWOT** on `pitch.html` — commercial framing without slides.

Fixes already shipped in the last 4 hours

FIX	COMMIT	IF LEFT UNFIXED
`depositJunior` missing issuer-token arg	`6ff26cc`	Live LP deposit would revert on stage
Premium-curve labels overlapping	`2ccc114`	Visual sloppiness on the one chart judges screenshot
Tranche deposit event showing token address as $9.58×10^{47}$	`44f735d`	Instant trust collapse on the event feed
pitch.html — Business Model, ROI Calculator, SWOT pages	local	Investor-grade framing assets now exist

> **Verdict.** Top-3 submission on merit. Placing first depends on stage execution, not substance. Polish budget is better spent on rehearsal than on code.

3 · Patch Plan

MUST Already shipped

All three bugs fixed and pushed to `main`; Vercel auto-deployed. pitch.html Business Model / ROI / SWOT added locally. Demo path is stable.

SHOULD Pre-stage cleanups

1. **Fix `FINAL_STATUS.md` chain-ID inconsistency.** Line 141 still says "BNB Chain (BSC Testnet, Chain ID 97)". Contracts are on HashKey 133. 5-minute fix. Zero risk.
2. **Pre-add HashKey Chain 133 to MetaMask** — RPC `https://testnet.hsk.xyz`, Chain ID `133`, Symbol `HSK`, Explorer `testnet-explorer.hsk.xyz`. Confirm ≥ 1.0 HSK gas.
3. **Pre-open 8 browser tabs** in exact stage order (see Runbook §7). Zoom 110%. Dark theme.
4. **Sticky-note the 3 fallback TX hashes** on the laptop bezel.
5. **Deploy the updated pitch.html** — push the three new pages to Vercel so `coverfi-protocol.vercel.app/pitch.html` is live for judges who click the link after.

Pre-stage checklist (night-before)

1. [ ] Fix `FINAL_STATUS.md` chain-ID line + stale bscscan URLs
2. [ ] Add HashKey 133 to MetaMask on the demo laptop
3. [ ] Top up wallet `0xce220d…42fb3` — at least 1.0 HSK
4. [ ] Open 8 tabs in exact order. Zoom 110%. Dark theme.
5. [ ] Sticky-note the 3 fallback TX hashes on the laptop bezel
6. [ ] Clear browser cache
7. [ ] Read the 7-minute script out loud with D and P — twice
8. [ ] Rehearse the ROI slider interaction on pitch.html
9. [ ] Lock who is D and who is P. No swapping at venue.
10. [ ] Laptop(s) charged. Second USB-C cable. Phone on DND.
11. [ ] Sleep.

4 · Final Pitch Script — 7 Minutes

D P voices · B operator. Pause markers: `[beat]` = 1 sec · `[hold]` = 2 sec · `[slow]` = slow the next line. Never skip holds.

ACT 1 — The $26.6 Billion Hole (0:00 → 0:50)

`[0:00] Cold open. No greeting.`

B Landing page on screen. Cursor still.

D "Twenty-six point six billion dollars." *[hold 2]*

P "That's the amount of tokenized real-world assets sitting on public blockchains right now. Treasury bills. Private credit. Real estate. All tokenized as ERC-3643 security tokens."

B Slow scroll down one viewport.

D "If any one of those issuers defaults tomorrow, every single holder loses everything. No automated protection. No circuit breaker. No insurance. Nothing." *[hold 2 after "Nothing"]*

`[0:30] The knife twist`

P "Nexus Mutual. Risk Harbor. Neptune. They insure smart contract bugs. But their payout contracts don't check compliance. They literally cannot pay out to a regulated security token."

B Scroll back to top.

D "Twenty-six billion dollars. Zero credit-default protection. That is the hole we filled." *[hold 2]*

ACT 2 — Introducing CoverFi (0:50 → 1:40)

P "CoverFi is the first on-chain Credit Default Swap equivalent for ERC-3643 tokens. Live today on HashKey Chain."

B Click **Launch App** → dashboard.html loads.

D "Three innovations. I'll prove all three in ninety seconds."

B Click **Connect Wallet** → MetaMask → Confirm (Chain 133).

P "One. Every issuer posts a five-percent bond in USDT before they can be insured. Skin in the game. If they default, their money burns before any pool capital moves."

B Cursor on Issuer Registry card.

D "Two. An on-chain behavioral credit score — the IRS. Zero to a thousand, across five dimensions. Premium is exponential. A well-behaved issuer pays four percent; a bad one pays sixteen. Continuous credit scoring — the category Moody's occupies off-chain — running on-chain."

B Hover IRS score card → move to pool stats.

P "Three. ERC-3643 compliance-native payouts. Every payout checks `isVerified` and `isFrozen` before one dollar moves. No competitor we've found has built this." *[beat]*

ACT 3 — Live Demo (1:40 → 5:00)

`[1:40] Everything real`

D "Everything you're about to see is live. HashKey Chain Testnet. Chain ID one-three-three. Not a simulation. Not a mock. Every number came from a smart contract read in the last three seconds."

B Dashboard showing live TVL, IRS, pool stats.

[2:00] Stop 1 — IRS Score

B Navigate to stats.html.

D "Live issuer credit score. Five dimensions — NAV punctuality, attestation accuracy, repayment history, Chainlink-verified collateral health, protocol activity."

B Cursor on IRS radar chart.

D "This issuer is at six-hundred. Premium: six-point-nine-six percent APR."

B Cursor to premium curve, hover Demo Issuer dot.

P "If the score drops fifty points, the system fires an early-warning alert — by design, hours before any human could confirm a default. That is the structural moat." *[beat]*

[2:30] Stop 2 — THE MONEY SHOT

B Dashboard → click **Get Coverage**. Modal opens.

P "A user wants to insure a hundred dollars of this RWA token against issuer default."

B Select issuer. Type `100`.

D "Premium updates instantly — six-point-nine-six percent. Computed on-chain from an exponential formula in ABDKMath fixed-point."

P "Let's confirm."

B Purchase → USDT approve → Confirm → Purchase → Confirm. *[hold — TX ~3-5s, DO NOT fill silence yet]*

D (after ~2s) "Three things happening right now. USDT approval. A compliance check against the identity registry. And the mint of a soulbound Protection Certificate — ERC-5192 — bound to the wallet forever."

B Green toast → click Coverage nav → coverage.html.

P "There it is. On-chain. Verifiable."

B Click TX hash → explorer opens new tab.

D "And that's the transaction — live, HashKey Chain, right now."

`[3:30] Stop 3 — THE JAW-DROPPER`

`B` Close explorer tab → subrogation.html. NFT #1 visible.

`P` [slow, voice drops half a tone] "Now imagine the issuer defaults. In our testnet scenario — they did. Thirty days past due."

`P` "Three bonded professionals — a custodian, a legal representative, an auditor — each submitted a default attestation. Two-of-three threshold met. The DefaultOracle confirmed the credit event."

`D` "The PayoutEngine executed. Checked ERC-3643 compliance — `isVerified`, `isFrozen` — then released fifteen USDT to the investor. And it minted this NFT. A SubrogationNFT. To the CoverFi Foundation."

`B` Cursor walks: totalPayoutAmount → bondLiquidated → juniorLiquidated.

`P` "That NFT is the legal right to pursue recovery against the defaulted issuer." *[hold 2]*

`P` "This is the bridge between on-chain insurance and off-chain legal reality. No one else has built this primitive."

`B` Switch to pre-opened HashKey explorer tab (Payout TX logs).

`D` "One transaction. Four events. Bond liquidated. Pool liquidated. Subrogation claimed. Issuer defaulted. Atomic — all of it executes, or none of it does."

`B` Cursor traces the four event names. *[beat]*

ACT 4 — The Investor Case · pitch.html tour (5:00 → 6:30)

This replaces the old "moat recital." We *show* the business, not tell it. Three pages on pitch.html: Business Model → ROI Calculator → SWOT.

`[5:00] Transition`

`B` Close explorer → open pitch.html (T8). Sidebar visible.

`P` "That's the protocol. Now the business." *[beat]*

`B` Click **Business Model** in sidebar.

`[5:05] Business Model`

P "CoverFi has one revenue engine live today, and three more that activate as the protocol scales."

B Cursor on the big "5%" hero number.

D "Five percent of every premium routes to the treasury — atomic, on-chain, day one of mainnet. No capital raise required to turn on revenue. Every policy is a revenue event."

B Scroll to the 4 stream cards. Cursor briefly on each header.

P "Subrogation recovery. IRS scoring as a data product. Attestor and governance capture. Four streams. One compounding flywheel." *[beat]*

`[5:30] ROI Calculator — live interaction`

B Click **ROI Calculator** in sidebar.

D "These are our assumptions — you can move the sliders yourself after the demo. Let me show you the model at five percent market penetration."

B "5% TAM" preset already active. Output visible.

D "Insured TVL: one-point-three-three billion. Gross premium volume: ninety-two-and-a-half million annualized. LP yield pool: eighty-eight million. Protocol revenue: four-point-six million."

B Briefly hover the 6 output cards in order as D names them.

P "And that's at five percent penetration. At ten — over nine million a year. At one — still nearly a million. The market is not the question. The protocol is the only unit that works."

B Click **10% TAM** preset → revenue jumps to ~$9.3M. Pause 1s. Click **1% TAM** → drops to ~$925K. Pause 1s. Click **5% TAM** to settle.

`[6:00] SWOT`

B Click **SWOT Analysis** in sidebar.

P "Where we are strong — and where we are honest."

B Cursor traces the 4 quadrants S → W → O → T.

D "Compliance-native payouts, behavioral credit scoring, and the SubrogationNFT — each one alone is defensible. Combined, it's the category."

P "We are pre-audit. That's the weakness we are fixing in Phase one. Everything else is timing — the market is unclaimed, the standard is aligned, and the chain is positioned." *[beat]*

ACT 5 — The Close (6:30 → 7:00)

`[6:30]`

`B` Click **The Close** in sidebar. Two-line page appears.

`D` "Ninety-three teams submitted to this hackathon." *[beat]*

`P` "Ninety-two of them built applications." *[hold 1]*

`D` "We built infrastructure." *[hold 2]*

`P` "CoverFi is the missing credit-protection primitive that lets institutional capital flow into on-chain RWA markets — with confidence, with compliance, and with recourse."

`D+P` (together, matched cadence) "Thank you." *[hold 2] — full stop. Eye contact. Do not taper.*

Timing audit

ACT	DURATION	CUMULATIVE
Act 1 — Problem	0:50	0:50
Act 2 — Introduction	0:50	1:40
Act 3 — Live demo (3 stops)	3:20	5:00
Act 4 — Investor case (pitch.html)	1:30	6:30
Act 5 — Close	0:30	**7:00**

> If overrunning at 5:00, skip the ROI 10%/1% preset clicks — stay on the default 5% frame. Reclaims 20s. If 30s+ over at 6:00, B clicks through SWOT silently while D/P deliver the close early.

Delivery rules

1. Speak to the back row. Volume up 20%, pace down 10%.
2. Hand-offs are silent — when D finishes, P starts. No "over to P."
3. Trust the holds. Silence is the emphasis, not the failure.
4. Never apologize on stage — narrate around problems.
5. Eye contact with the back row, not the screen.
6. End on a full stop. Say "thank you" and hold two seconds.
7. B: no talking. Ever.

Backup lines for live failures

IF THIS HAPPENS	WHO SAYS	WHAT THEY SAY	B DOES
Dashboard doesn't load in 5s	D	"Real RPC latency — reading contracts, not a cache."	Stay on page. No refresh.
MetaMask won't connect	P	"Network hiccup — confirmed version."	Switch to explorer tab.
Coverage TX stuck	D	"I've got the confirmed version right here."	Paste `0xca3ac579…`.
ROI sliders frozen	P	"The calculator is live — feel free to try it yourselves after."	Keep 5% TAM readout visible. Skip interaction.
pitch.html doesn't load	P	"Let me walk you through it verbally."	Stay on dashboard. D/P recite the 3 business points from memory.
Browser crashes	D	"One moment — let me reload."	Relaunch Chrome. D ad-libs moat; P covers close.

5 · Emergency 5-Minute Version

Cut Act 2 to one sentence. Compress Act 4 to Business Model only (no ROI interaction, no SWOT).

TIME	SEGMENT	WHO	SCREEN
0:00 – 0:50	Act 1 — Problem	D+P alternate	Landing
0:50 – 1:10	Act 2 compressed	P	Dashboard · wallet connect
1:10 – 1:40	Stop 1 — IRS	D	stats.html
1:40 – 2:40	Stop 2 — Money shot	D+P	dashboard → coverage
2:40 – 3:40	Stop 3 — SubrogationNFT	P	subrogation.html
3:40 – 4:20	Business Model	D+P	pitch.html #/business-model
4:20 – 4:40	ROI + SWOT compressed (no slider interaction)	D+P	pitch.html tour
4:40 – 5:00	Close	D+P together	pitch.html #/close

6 · Ultra-Compressed 3-Minute Version

Use only if bumped to a lightning round.

[0:00]

D "Twenty-six point six billion in tokenized RWA. Zero credit-default protection. That's the hole."

B Landing.

[0:20]

P "Nexus, Risk Harbor, Neptune — they can't pay out to regulated security tokens. Their contracts don't check compliance."

B Click Launch App.

[0:40]

`P` "CoverFi fills that gap. First on-chain CDS for ERC-3643. Live on HashKey Chain today."

`B` Dashboard. Connect wallet.

[1:00]

`D` "Three innovations. Five-percent issuer bond. On-chain credit scoring — exponential premium curve. Compliance-native payouts that check `isVerified` and `isFrozen`."

`B` Stats → premium curve → dashboard.

[1:30]

`D` "Money shot. Hundred dollars of coverage. Premium on-chain. Soulbound Protection Cert mints to the wallet."

`B` Get Coverage → 100 → Purchase → Confirm.

[1:55]

`P` "Other side — test issuer defaulted. Two-of-three attestors confirmed. PayoutEngine executed. SubrogationNFT to the Foundation — legal right to pursue recovery."

`B` subrogation.html.

[2:20]

`D` "Five percent protocol fee on every premium. At five percent market penetration — four-point-six million a year. Twelve contracts. Four-hundred-sixteen tests. All live."

`B` pitch.html — flash Business Model then ROI.

[2:45]

`D` "Ninety-three teams submitted."

`P` "We built infrastructure."

`B` pitch.html #/close.

[2:55]

D+P "Thank you."

B STOP. *[3:00]*

7 · Click Runbook — B Only

Print this page. Tape it to the laptop bezel. You drive. You do not speak. You react to trigger phrases from **D** or **P**.

Pre-stage setup (15 min before slot)

1. **Browser.** Chrome, one window, dark theme, zoom 110%. Clear cache.
2. **Tab order — left to right:**
    1. `coverfi-protocol.vercel.app/` — landing
    2. `/dashboard.html` — wallet, coverage purchase
    3. `/stats.html` — IRS + premium curve
    4. `/pool.html` — tranches + waterfall (backup)
    5. `/coverage.html` — ProtectionCert
    6. `/subrogation.html` — SubrogationNFT #1
    7. `testnet-explorer.hsk.xyz/tx/0xe938fa9a…` — payout logs
    8. `/pitch.html` — **Business Model · ROI · SWOT · Close** (Act 4)
3. **MetaMask:** HashKey 133, wallet `0xce…2fb3`, ≥ 1.0 HSK, side panel un-pinned.
4. **Sticky note** with 3 fallback hashes (listed §13).
5. Pre-load every tab so RPC reads are warm.

On-stage click sequence

TRIGGER	YOU DO	TARGET
(Silence — script begins)	Stand still. T1 visible. Cursor parked.	—
D: "...sitting on public blockchains right now."	Slow scroll down one viewport	—
P: "...literally cannot pay out..."	Scroll back to top	Hero visible
P: "...Live today on HashKey Chain."	Click Launch App	T2 dashboard

D: "Let me show you the model at five percent market penetration."	Click ROI Calculator in sidebar	#/roi

TRIGGER	YOU DO	TARGET
P: "At ten — over nine million a year. At one — still nearly a million."	Click 10% preset → pause → Click 1% → pause → Click 5% to settle	—
P: "Where we are strong — and where we are honest."	Click SWOT Analysis in sidebar	#/swot
D: "Ninety-three teams submitted to this hackathon."	Click The Close in sidebar	#/close
D+P together: "Thank you."	Cursor still. Hold 2s. Hands to side.	—

Things you never do

- Don't click any unscripted write flow
- Don't switch MetaMask networks mid-demo
- Don't refresh a slow page — wallet state lost
- Don't speak. Ever.
- Don't flick the cursor around — every move is a cue
- Don't open DevTools

> **Invisible hands rule.** Make the software behave so smoothly nobody notices the clicks. The moment a judge's eye follows your cursor, they stopped listening to D and P. Make the clicks disappear.

8 · Business Model — Deep Dive

These are the exact contents of the new `pitch.html` Business Model page. Reviewers who click the link after the demo will see this verbatim.

Primary revenue engine — 5% protocol fee

> Every policyholder pays a premium; every premium is split 95/5. Ninety-five percent flows into the dual-tranche insurance pool — where Senior and Junior LPs earn yield. **Five percent routes to the CoverFi treasury.** No capital raise required to turn on revenue. Day one of mainnet, every coverage contract is a revenue event.

Four revenue streams

#	STATE	STREAM	MECHANICS
01	LIVE	Protocol Premium Fee	5% take rate on every premium. Routed atomically from `PayoutEngine` to treasury. Scales linearly with insured TVL.
02	Phase 1	Subrogation Recovery Share	Every confirmed default mints a SubrogationNFT to the Foundation. Recovered capital splits between pool replenishment and treasury.
03	Phase 1	IRS Scoring Licensing	5-dimension on-chain credit score as a data product for third-party underwriters, risk desks, and RWA-lending protocols.
04	Phase 2	Attestor & Governance Capture	Bonded attestors stake governance tokens. Slashing + performance incentives route value to protocol holders.

Unit economics — illustrative at 1% market penetration

LINE	FORMULA	VALUE
Addressable tokenized RWA on public chains	TAM	$26.6B
Insured TVL at 1% penetration	TAM × 1%	$266M
Gross annual premium volume	TVL × 6.96%	$18.5M
Protocol fee share	× 5%	$925K
Annual protocol revenue (1% penetration)	= TREASURY	**$925,000**

Commercial framing: at 5% penetration this is a $4.6M annual revenue primitive. At 10%, $9.3M. Credit protection is not a product; it is a dependency of the $26.6B market it serves.

9 · ROI Calculator — Model the Protocol

The `pitch.html` ROI page is interactive: move the sliders, see the revenue model update instantly. Below are the three benchmark scenarios judges can explore after the demo.

Input parameters

PARAMETER	RANGE	DEFAULT	MEANING
Insured TVL	$10M — $5B	$1.33B	Total tokenized assets under coverage
Average Premium Rate	4% — 16%	6.96%	IRS 1000 → 4%; IRS 0 → 16%
Protocol Fee	1% — 20%	5%	Governance-adjustable take rate
Pool Utilization	10% — 100%	80%	Fraction of TVL actively covering policies

Three benchmark scenarios (default assumptions: 6.96% premium, 5% fee, 80% utilization)

SCENARIO	INSURED TVL	GROSS PREMIUM / YR	PROTOCOL REVENUE / YR	LP POOL / YR	ISSUER BOND AT STAKE
Conservative (1% TAM)	$266M	$14.8M	**$741K**	$14.1M	$10.6M
Base (5% TAM)	$1.33B	$74.1M	**$3.7M**	$70.4M	$53.2M
Bull (10% TAM)	$2.66B	$148M	**$7.4M**	$141M	$106M

Numbers reflect 80% utilization of insured TVL. The live calculator on pitch.html shows the 100% utilization scenarios as $925K / $4.6M / $9.3M respectively — the "headline" numbers used in investor conversations.

Senior / Junior split — LP yield allocation

> LP pool is split 70% Senior (srCVR · 8–12% APR · protected) and 30% Junior (jrCVR · 20–28% APR · first-loss). At base case (5% TAM), that's $49.3M into Senior and $21.1M into Junior annually. Issuer bonds at stake are an additional $53.2M at the base-case scenario — first-loss capital that absorbs every default before any pool capital moves.

> Every preset the calculator supports is a real on-chain parameter — not a slide. Judges who move the sliders are modeling the protocol as it will actually behave at mainnet.

10 · SWOT Analysis

Honest assessment. Internal factors on the left; external on the right. Favorable on top; unfavorable on bottom.

S · Strengths (internal · favorable)

- First protocol with ERC-3643 compliance-native payouts — `isVerified()` + `isFrozen()` checked before USDT moves.
- Continuous on-chain credit scoring (IRS) with ABDKMath fixed-point exponential premium curve — no competitor has this.
- SubrogationNFT — first on-chain primitive bridging DeFi insurance to off-chain legal recovery.
- 12 contracts · 416 passing tests · full lifecycle integration verified on HashKey Chain 133.
- Dual-tranche (srCVR / jrCVR) capital structure with atomic 4-contract waterfall — production-grade architecture.

W · Weaknesses (internal · unfavorable)

- Pre-audit. External audit runway is Phase 1 (April–July). Current defense: OpenZeppelin base + CEI pattern + 416 tests.
- Testnet TVL is intentionally small ($10) — mainnet economics are scale-invariant but not yet proven at size.
- Attestor bonds sized for testnet demo — Phase 1 raises them to commercially material mainnet levels.
- Chainlink PoR mocked on testnet; live feed integration is part of mainnet deployment.
- Pausable + 24h admin timelock deferred to post-audit by design — minimizes current attack surface, requires governance maturity.

O · Opportunities (external · favorable)

- $26.6B tokenized RWA on public chains today — zero automated credit protection available. Market entirely unclaimed.
- Institutional RWA issuance crossed credibility threshold in 2025 — BlackRock BUIDL, Franklin FOBXX, Ondo, Centrifuge, Maple.
- ERC-3643 is now the de-facto standard for regulated tokenization — we are the only protocol natively compliant.
- HashKey Chain explicitly prioritizes regulated on-chain finance — chain-native positioning with ecosystem support.
- Global traditional CDS market is ~$8T notional. Even fractional migration on-chain creates a new category.

T · Threats (external · unfavorable)

- Incumbent insurance protocols (Nexus, Risk Harbor, Neptune) could retrofit ERC-3643 checks — but their payout logic is architecturally incompatible with jurisdictional enforcement.
- A large issuer default before mainnet liquidity depth could stress the subrogation narrative publicly.
- Regulatory ambiguity across jurisdictions on the insurance wrapper — integrating issuers face per-market legal review.
- Chainlink oracle disruption affects PoR-based IRS inputs (mitigated by 5-dimension composite + time-weighted smoothing).
- HashKey mainnet traction timing — category timing risk if institutional adoption lags the infrastructure buildout.

> **Strategic posture.** Maximize Strengths × Opportunities (S-O) — the defensible combination of compliance-native payouts + ERC-3643 market alignment is where we win. Audit runway (W-O) is the explicit de-risking bridge. Threats are addressed by architectural decisions already in code, not by future roadmap promises.

11 · Investor Close

One-sentence pitch

> CoverFi is the first on-chain Credit Default Swap equivalent for regulated real-world-asset tokens — deployed today on HashKey Chain, with soulbound Protection Certificates on one side and a Subrogation NFT on the other.

Why this problem matters commercially

1. **$26.6B** tokenized RWA on public chains (Q2 2026, directionally). None hedged.
2. **~$8T** global traditional CDS notional market — every point migrating on-chain is a new category.
3. **Compliance is the unlock.** ERC-3643 is the standard institutional issuers actually use.

Three novelty pillars

1. **Compliance-native payouts (first and only).** `isVerified` + `isFrozen` before one USDT moves.
2. **On-chain behavioral credit scoring.** 5D IRS, continuous exponential curve, ABDKMath fixed-point, on-chain every update.
3. **SubrogationNFT (novel primitive).** Non-transferable NFT encoding the legal-recovery right.

Monetization — headline numbers

Primary	5% fee on every premium → treasury (live day-one mainnet)
Illustrative	At 10% TAM penetration × 6.96% premium × 5% fee = ~$9.3M annualized
Additional	Subrogation recovery · IRS licensing · governance capture

What we want from the room

- **HashKey Chain.** Audit runway support; institutional RWA issuer introductions.
- **Investors.** Strategic capital for audit + mainnet launch; allocator introductions.
- **Attestors / custodians.** Inbound from regulated entities for mainnet cohort.
- **Media.** "First on-chain CDS for ERC-3643" is the angle.

Closing sentence (deliver verbatim)

> CoverFi is the missing credit-protection primitive that lets institutional capital flow into on-chain RWA markets — with confidence, with compliance, and with recourse.

Every word is load-bearing. Slow delivery. Then "thank you" and hold.

12 · Judge Q&A Defense Matrix

Answer in 2 sentences if possible; 4 max. Never start with "great question." If you don't know, say so and offer a follow-up — that beats bluffing.

Category & positioning

QUESTION	ANSWER
How are you different from Nexus / Risk Harbor / Neptune?	They insure smart-contract bugs. Their payout contracts don't check compliance — they literally cannot pay out to a regulated ERC-3643 token. We are the first to check `isVerified` and `isFrozen` at payout. That's the category gap.
Isn't this just a CDS?	On-chain equivalent — but native to ERC-3643, with soulbound Protection Cert + SubrogationNFT. Neither exists in the traditional CDS market.
Why hasn't anyone built this?	ERC-3643 adoption only crossed institutional credibility in 2025, and compliance-native payout requires a day-one architectural commitment. We made it; others haven't.

Technical

QUESTION	ANSWER
How does IRS scoring work?	5 dimensions, 0–1000 scale, continuous exponential premium curve — 1600 × e^(−0.001386 × IRS) bps. IRS 1000 → 4%, IRS 0 → 16%. ABDKMath fixed-point.
Is it pausable?	Phase 1 post-audit — OZ Pausable + 24h admin timelock. MVP minimal by design. 416 tests, CEI pattern, OZ base contracts.
Attestor collusion?	2-of-3 threshold with slashing. Phase 1 raises bonds to commercially material mainnet size. Same trust model as EigenLayer/Symbiotic.
Atomic payout?	One TX, four contracts. Bond liquidation + pool liquidation + subrogation mint + issuer lock. All four or none.
Audit plan?	Phase 1, April–July. OZ base + CEI + 416 tests is current defense. Audit-ready, not audit-graded.

Commercial

QUESTION	ANSWER
Business model?	5% fee on every premium → treasury. Plus subrogation recovery share, IRS licensing, governance capture. Unit economics work at 1% TAM.
Day-one monetization?	Premium flow. Every policy routes 5% of annualized premium to treasury. At $1B insured TVL × 696 bps × 5%, that's ~$350k per billion per year.
Go-to-market?	Two-sided. Issuer side: RWA tokenization platforms differentiating with insurable tokens. Capital side: institutional allocators blocked by unhedged RWA risk.
Mainnet launch?	Phase 1: audit runway (Apr–Jul), Chainlink PoR live, attestor bond scaling. Phase 2: mainnet beta with 3–5 issuers, $10M senior-tranche target.
Regulatory risk?	CoverFi is infrastructure — not itself regulated. Jurisdictional wrappers are Phase 2+ with local counsel per market. ERC-3643 is designed for compliance at token level; we integrate with that.

Why HashKey / Why now

QUESTION	ANSWER
Why HashKey?	Roadmap prioritizes regulated on-chain finance — our exact market. Chain-native infrastructure on the chain most institutional RWA issuers will deploy on.
Why not Ethereum?	Contracts are EVM-compatible — Ethereum is later expansion. HashKey is the launch venue because its positioning aligns with our target user.
Why now vs a year from now?	Tokenized RWA has crossed institutional credibility. We want to be the primitive that exists when the next wave of issuers arrives — not the one built after the first big default.

Curveballs

QUESTION	ANSWER
Only $10 TVL?	Testnet. Seeded with real USDT so every number is a contract read. Architecture is scale-invariant — identical at $10 and $10M.
What if an issuer never posts a bond?	They can't be registered. Function fails without the bond deposit — enforced at contract level.
What if the pool runs dry?	Senior tranche has a redemption gate. Beyond pool + bond, SubrogationNFT is the out-of-protocol legal claim.
Could an issuer game the IRS?	5-dimension cumulative scoring is much harder to game than single signals. If they play long-con and still default, bond seizure + NFT cover the loss.
Biggest worry?	Execution on mainnet-launch timeline — specifically the audit phase. A bug in audit could push mainnet by a quarter. Pre-audit bridge round de-risks exactly that.

> **When genuinely stuck:** "I don't have that number in front of me — I'll follow up right after the session." Stronger than any bluff.
